

CHERRY EYE

MEDICAL DISCLOSURE FOR CHERRY EYE

This pet had a prolapse of the third eyelid gland (gland that had popped out of its normal position). The prolapse was surgically repaired while at the Arizona Humane Society. He/she will need to wear an e-collar for two weeks after the procedure to ensure the pet does not rub at the eye and cause failure of the surgery. The pet may still be on medications to help with post-operative inflammation and healing. Although surgery is usually successful, there is a chance that the gland may prolapse in the future and the pet may require additional surgery. All follow-up care will need to be done at the owner's veterinarian and at the owner's expense.
